

Wholesale Cloth Distribution Software — Requirements Document

Overview

A cloud-based web portal (accessible on desktop and mobile browser) for the business owner/admin, plus a separate, dedicated mobile app (installable on phone, not browser-based) for salesmen. The business sells cloth by the yard to shops (clients) on cash and credit, with salesmen handling deliveries and recoveries in the field. Scale: 1000+ client shops.

1. Client (Shop) Profile

Shop name, serial/shop number, owner name, city, GPS coordinates, credit limit (with on/off toggle), default discount % (editable per transaction by salesman), report filter (custom date range), total purchase, total credit, total recovery, always linked under one salesman.

2. Salesman Profile

Name, contact number, assigned route/area, report filter (weekly/monthly/custom date range), current inventory in hand, total sales, total recovery, total commission, current cash in hand.

3. Transaction Module (Sale)

Client selected by name or serial number, item selected, yards, rate per yard (auto-filled from company rate, editable by salesman), discount (auto-filled from client default, editable), cash or credit, date, WhatsApp-shareable receipt.

4. Recovery Module

Client selected, recovery amount, payment mode (cash/POS/bank), date, WhatsApp-shareable receipt. Salesman's cash-in-hand updates automatically with each recovery. When salesman deposits collected cash to office (cash or bank), that amount is deducted from the salesman's cash-in-hand and added to office cash/bank balance.

5. Return Module

Separate "Returned Stock" section showing which salesman and which client returned goods, yards returned, linked to original transaction, admin reviews and confirms return, adjusts client balance and salesman inventory accordingly.

6. Discount Handling

Default discount % set at client profile level; salesman can override/edit at time of transaction. Tracked in both salesman-wise and client-wise reports as a separate discount column.

7. Inventory Module

Inventory with cost price so total stock value is known. When stock is issued to a salesman, it moves from main inventory into that salesman's account (with value). When salesman sells to a client, yards/items and value move out of salesman's account into the client's record.

8. Vendor Module

Vendor profile, transaction history (amount paid, amount owed, advance payments), WhatsApp-shareable receipt for vendor transactions.

9. Expense Module

Expenses added by office only, source selected as cash or bank (amount deducted from whichever is chosen). Separate account for salesman-related expenses (e.g., vehicle/fuel expense), added only by office, tracked against that salesman.

10. Commission Module

Commission calculated per salesman based on recovery/sales (formula/filter based, e.g., date range), showing commission earned, commission already taken/paid, and remaining balance. Needs to support ad-hoc/manual adjustment since commission payout timing varies.

11. Admin Overview (Dashboard)

Cash in hand (office), cash in bank (office), total credit outstanding, total sales (with report filter), total recovery (with report filter), salesman-wise reports, expense history, inventory value, vendor accounts summary.

12. User Roles & Access

Main Admin: full view + edit access. Accountant login: separate, limited access role.

13. Search Module

Search/filter by salesman, by customer name/serial number/city. Necessary given 1000+ shops.

14. Offline Mode

Required — salesman app must allow entries (sales/recovery) without internet, auto-sync once connection is restored.

15. Mobile App (Salesman)

Simple, easy-to-use interface. Urdu language option required if feasible.

16. Platform

Cloud-based system. Admin: web portal, accessible on both desktop and mobile browser.

Salesman: a dedicated, installable mobile app only (no mobile browser access).

Open Points To Confirm Before Development

- Exact commission formula/structure
- List of report filters needed beyond date range (e.g., item-wise, area-wise)
- Whether accountant role needs restricted module access (e.g., no salesman/client edit rights)
